

FASprofill – fill up with benefits.

- A complete spectrum of filling systems from one single source
- Different modularized ranges for optimum system solutions
- Easy integration into existing production processes
- Parallel filling of different fluids
- Less production time and saved space at the end of the assembly line through combined filling processes
- Low maintenance costs and minimum downtime
- Options for special configurations in all product ranges and degrees of automation

FASprofill – always on stream.

The right solution every time.

Modern fluid filling stations used in automobile production need to meet very varied requirements. With innovative technology, short cycle times and easy operation filling equipment Dürr Factory Assembly Systems complies with even the highest of global quality standards.

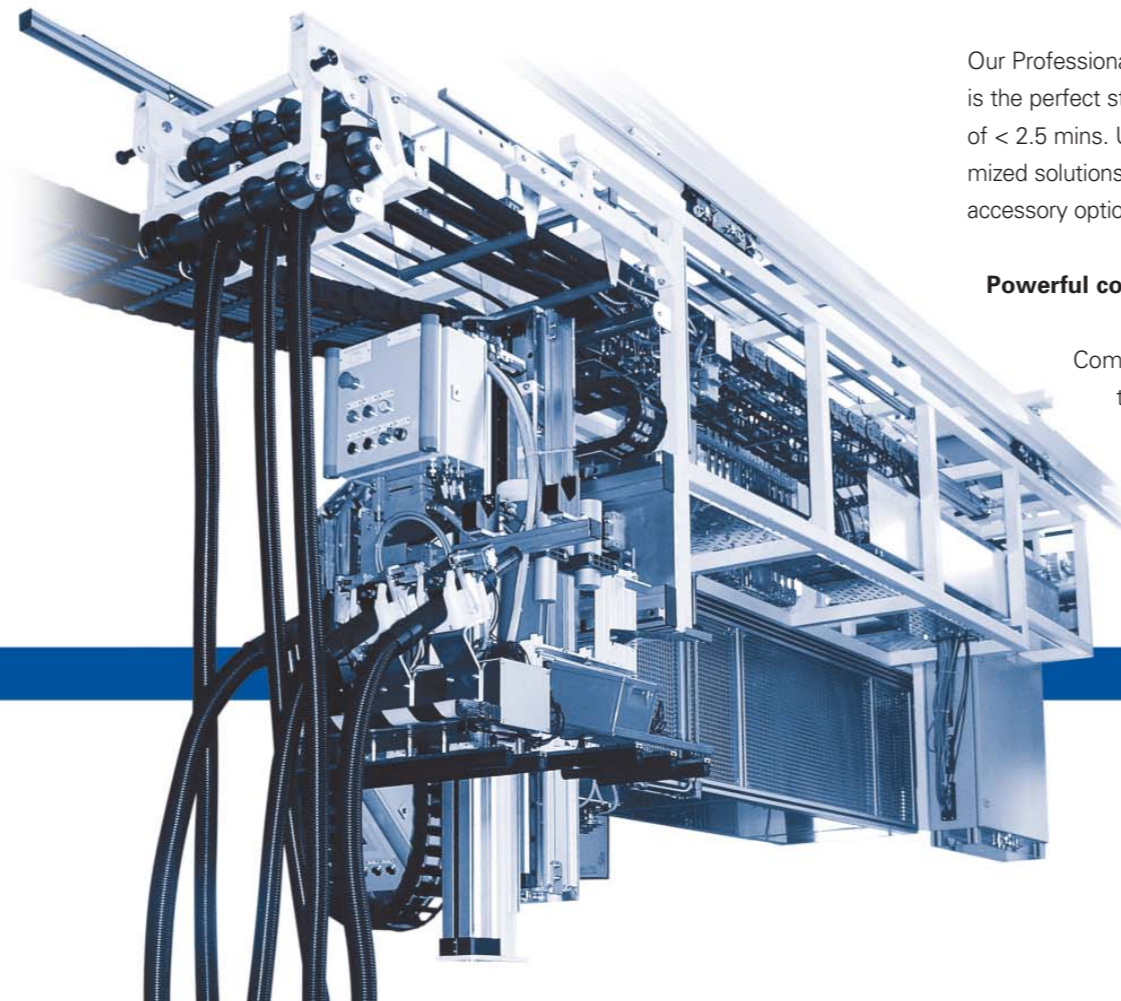

Be it power steering, ABS brake systems, clutches, engines, transmissions, radiators or air conditioning units – Dürr offers optimum solutions whatever the application. Whether a simple individual unit or a full solution combining high performance and multi-function technology is required – the end result is what's important – dependable processes and satisfied customers.

FASprofill – innovative and influential.

We fill in spaces.

Integration into existing production processes is easy with our modular filling stations.

We have used our extensive practical experience to develop different filling station ranges: Essential, Compact, Professional/Premium and Combined systems. Their modular design provides the flexibility that enables us to offer solutions to suit widely differing customer requirements.

FASprofill – keeps things flowing.

The perfect introduction.

Essential units are the optimum answer to vacuum pressure filling requirements on SKD and CKD assembly lines (cycle time > 3 mins). Low maintenance costs, trouble-free installation and ease of operation are features that speak for themselves.

Compact flexibility.

Our space saving Compact units are especially suitable for slower assembly lines (cycle time > 2.5 mins), repair areas or for use in experimental fields. Flexibility highlights: process design and vision systems.

The intelligent all-rounder.

Our Professional unit with its movable console and rail system is the perfect station for fast production lines with a cycle time of < 2.5 mins. Under the Premium label we can supply customized solutions to suit individual configurations, equipment and accessory options and automation requirements.

Powerful combinations.

Combined systems allow different filling processes to be carried out in parallel – in large volume production for example, this brings savings in terms of investment cost, production time and space at the end of the assembly line.

FASprofill – fulfillment through high quality.
